# What is Rectangular Floor Plan(RFP) ??

A Rectangular Graph is a graph where all regions are four-sided and all edges are oriented in either the vertical or horizontal direction. In addition the graph enclosure must also be rectangular.

# Application of Rectangular Floor Plan

- architectural design
- compacting of electronic circuits

# FINDING IF THE RFP EXIST!

Given a planar graph on 'n' vertices, if the graph is not subgraph of Maximal rectangular floor plan graph, RFP representation of that graph doesn't exist. So, Maximal RFP are of much use.

Maximal RFPG

RFP doesn't exist

# PROBLEM STATEMENT

Given number of vertices( $n$ ), the problem is to enumerate all Maximal rectangular floor plan having 'n' rooms.

Maximal RFP on 7 vertices

# KEY IDEA & PREVIOUS WORK

RFP( $n$ ) is best connected(Maximal) if and only if it has only four rooms on the boundary.

Now, the problem gets reduced on finding Rectangular floor plan(RFP) on ' $n-4$ ' vertices & we call the dual graph corresponding to it as INNER GRAPH.

Maximal RFP on 8 vertices

Inner graph

RFP on 4 vertices

# INNER GRAPH & CORRESPONDING RFP

Inner graph on 'n-4' (3) vertices

Maximal RFP on 7 vertices

# ENUMERATION OF ALL INNER GRAPH

Number of edges = 5

Number of edges = 6

Number of edges = 7

**THANK YOU**
